IBM Platform-BPM

Customer Requirement

The platform has been designed to meet the various banking requirements. The BankFusion(BF) platform had to be integrated with IBM Websphere Process Server. Client required a solution to architect and implement by a vendor with BI expertise.

Solution Provided

The BF platform with its unique work flow management capability was integrated to the Process Server work flow engine (Human Task Manager) with APIs.

There were two parts to the solution:

- Wrapping the HTM APIs and exposing them through BF platform for their client applications to access them.
- Creating work flows in HTM to handle all user storied for the various modules.

Benefits to the Client

- The architecture provides a futuristic scope for multiple channels for client applications.
- The solution was inline with the existing architecture to leverage existing assets.
- Decoupling of the services(systems and modules) which enables better maintainability
- Ability to integrate the existing client application with minimal effort (with zero coding)

Organization
Leading Financial Service Provider

Industry Sector
Banking

Scope
Development of business process and human tasks activities.

Environment
IBM WS Process Server 7.0.0.7
IBM WS Application Server ND 7.0
IBM DB2 9.5, UDDI, AIX

Development Tools
IBM WID 7.0, SVN

Engagement Model
Onsite-Offshore model
